

Resource optimisation

We can develop railway timetables and resource plans to help you meet your business and contractual objectives.

The issues

Having the adequate and appropriate resources both physical and human in relation to time and place is essential for the smooth operation of the railways. Ensuring those physical resources are fit for purpose; that crews are competent, well trained and meet with current employment and legislative conditions is a challenging balancing act. Any plans developed must be also flexible enough to meet the ever changing daily circumstances whilst maximising staff productivity and maintaining cost effectiveness.

Our capability

Through many years of technical expertise in the field we can;

- develop service patterns to either forecasted demand or contractual obligations;
- develop a complete service offer as one timetable for approval;
- modify plans in order to comply with access offers from the network owner;
- assign rolling stock to meet passenger demand on each service;
- determine journey times for service patterns;
- produce service cycle diagrams showing the rolling stock usage;
- using bespoke software produce train crew diagrams and work on their allocation;
- work with marketing teams to develop and communicate timetable documentation through a variety of mediums; and
- determine overall proposal costs for business plan development.

We can help to secure a more cost effective resource base without compromising service delivery or safety. We can achieve this by maximising resource flexibility with practical applications. We can provide comprehensive resource programmes to underpin levels of consistent service delivery.
